

**WINTER-16 EXAMINATION**  
**Model Answer**

**Important Instructions to examiners:**

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

Order of reaction can have a fractional value.	3	Shows the elementary mechanism or separate steps of a complicated process	Shows the kinetic dependence of the rate on the concentration of the reactants.	4	Depending upon the value of molecularity, reaction can be unimolecular, bimolecular etc.	Depending upon the value of order, the reactions are termed as first order, second order reactions	5	Molecularity is a theoretical quantity	Order of reaction is entirely an experimental value.	1 mark each for any 4 points
Sr.No.	Molecularity	Order of reaction																		
1	Molecularity is the number of molecules, atoms or ions in a chemical reaction.	Order of reaction is the sum of exponents of the concentration terms involved in the rate equation.																		
2	Molecularity always have an integer value 1,2,3...	Order of reaction can have a fractional value.																		
3	Shows the elementary mechanism or separate steps of a complicated process	Shows the kinetic dependence of the rate on the concentration of the reactants.																		
4	Depending upon the value of molecularity, reaction can be unimolecular, bimolecular etc.	Depending upon the value of order, the reactions are termed as first order, second order reactions																		
5	Molecularity is a theoretical quantity	Order of reaction is entirely an experimental value.																		
1A-b	<b>Relation between <math>K_p</math> and <math>K_c</math> (Derivation)</b> Consider the reaction $aA + bB + \dots \rightarrow rR + sS + \dots$	4																		

**WINTER-16 EXAMINATION**  
**Model Answer**

Subject code 17562 page 3 of 28

	$K_c = (C_R^r \cdot C_S^s) / (C_A^a \cdot C_B^b)$ <p>For ideal gas <math>C_i = p_i / RT</math></p> <p>Therefore <math>K_c = \{ (p_R / RT)^r \cdot (p_S / RT)^s \} / \{ (p_A / RT)^a \cdot (p_B / RT)^b \}</math></p> $= (p_R^r \cdot p_S^s) / (p_A^a \cdot p_B^b) \cdot (1 / RT)^{(r+s+\dots-(a+b+\dots))}$ <p>R is the ideal gas constant</p> <p>T the absolute temperature in K</p> <p>P is the pressure in atm</p> <p>ie <math>K_c = K_p \cdot (1 / RT)^{\Delta n}</math> where <math>K_p = (p_R^r \cdot p_S^s) / (p_A^a \cdot p_B^b)</math></p> <p><math>\Delta n = (r + s + \dots - (a + b + \dots))</math> is the difference in the number of moles of product and reactant</p> <p>Or <math>K_p = K_c \times (RT)^{\Delta n}</math></p>	
1A-c	<p><b>Autocatalytic reactions:</b> A reaction in which one of the products of the reaction acts as a catalyst is called as an autocatalytic reactions.</p> <p>Eg1. <math>\text{CH}_3\text{COOC}_2\text{H}_5 + \text{H}_2\text{O} \rightarrow \text{CH}_3\text{COOH} + \text{C}_2\text{H}_5\text{OH}</math></p> <p>Here <math>\text{CH}_3\text{COOH}</math> acts as catalyst</p> <p>2. Oxidation of a solution of oxalic acid by an acidified solution of <math>\text{KMnO}_4</math>.</p> $2\text{MnO}_4^- + 6\text{H}^+ + 5(\text{COOH})_2 \rightarrow 2\text{Mn}^{2+} + 10\text{CO}_2 + 8\text{H}_2\text{O}$ <p style="text-align: center;">Oxalic acid</p> <p>The reaction is very slow at room temp. The reaction is catalyzed by manganese ions (<math>\text{Mn}^{2+}</math>) that are not present at start of reaction, hence the rate of reaction is extremely slow. Once reaction starts, <math>\text{Mn}^{2+}</math> ions are formed, the rate of reaction speeds up.</p>	<p>2</p> <p>2 mark for any 1 eg.</p>
1A-d	<p><b>Graphical representation:</b></p> <p><b>MFR</b></p> <p>The performance or design equation is</p> $V / F_{AO} = \tau / C_{AO} = X_A / -r_A$	

**WINTER-16 EXAMINATION**  
**Model Answer**

Subject code

17562

page 4 of 28

For constant density system

$$V C_{A0} / F_{A0} = \tau = C_{A0} X_A / -r_A = (C_{A0} - C_A) / (-r_A)$$

**PFR**

The performance or design equation is

$$\frac{V}{F_{A0}} = \int_0^{x_A} \frac{dX_A}{-r_A} = \frac{\tau}{C_{A0}}$$

Subject code 17562 page 10 of 28

<p>1. Precipitation 2. Gel formation 3. Simple mixing 4. Impregnation method</p> <p><b>1.Precipitation method :</b> This method produces catalyst in porous form.It consists of adding a precipitating agent to the solution of the desired component. The precipitation is followed by washing,drying, calcinations &amp; activation(or pretreatment) Eg. Magnesium oxide catalyst is prepared by this method. It is prepared by precipitating <math>MgCO_3</math> from magnesium nitrate solution by adding sodium carbonate.The magnesium carbonate precipitate is washed, dried &amp; calcined to obtain magnesium oxide.</p> <p><b>2.Gel formation:</b>If the precipitate formed in the above method is colloidal, then gel is formed. Eg Catalyst containing silica and alumina are suitable for gel formation because their precipitates are colloidal in nature.</p> <p><b>3. Simple mixing:</b> Some porous materials are obtained by mixing the components with water, milling to the desired grain size, drying and calcining. Such materials may be ground and sieved to obtain the particle size. Eg Mixed Mg and Ca oxide catalyst is prepared by this method</p> <p><b>4. Impregnation method:</b> This method is used for the preparation of expensive catalysts like platinum, palladium, silver etc. A catalyst carrier provides a means of obtaining a large surface area with a small amount of catalyst. The steps in the preparation of a catalyst impregnated on a carrier include evacuating the carrier, contacting the carrier with the impregnating solution, removing the excess solution, drying, calcining and activation.</p>	<p>1.5 marks each</p>

4A-c	<b>Integrated form of rate expression for zero order reaction</b>			

**WINTER-16 EXAMINATION**  
**Model Answer**

Rate equation is  $-r_A = -\frac{dC_A}{dt} = C_{A0} \frac{dx_A}{dt} = k$

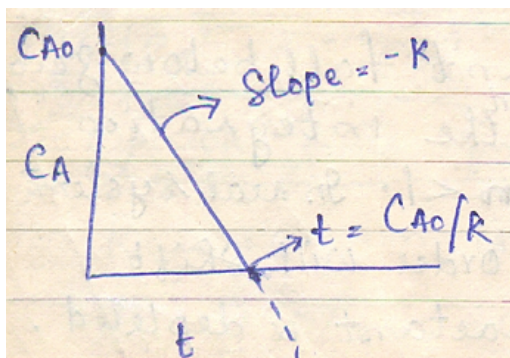

**In terms of concentration**

$$-\frac{dC_A}{dt} = k$$

Integrating between appropriate limits

$$\int_{C_{A0}}^{C_A} -dC_A = k \int_0^t dt$$

$$C_{A0} - C_A = kt \text{ for } t < \frac{C_{A0}}{k}$$

**In terms of fractional conversion**

$$C_{A0} \frac{dx_A}{dt} = k$$

Integrating between appropriate limits

$$C_{A0} \int_0^{x_A} dx_A = k \int_0^t dt$$

$$C_{A0} X_A = kt \text{ for } t < \frac{C_{A0}}{k}$$

	<p>2</p>

**WINTER-16 EXAMINATION**  
**Model Answer**

Breaking the L.H.S. of the above equation into partial fractions & then integrate it

$$\frac{A}{(1 - X_A)} + \frac{B}{(M - X_A)} = \frac{1}{(1 - X_A)(M - X_A)}$$

$$\frac{A(M - X_A) + B(1 - X_A)}{(1 - X_A)(M - X_A)} = \frac{1}{(1 - X_A)(M - X_A)}$$

$$A(M - X_A) + B(1 - X_A) = 1$$

Substituting  $X_A = 1$ , we get  $A(M - 1) = 1 \therefore A = \frac{1}{(M-1)}$

Substituting  $X_A = M$ , we get  $B = -\frac{1}{(M - 1)}$

Putting values of A and B, we get

$$\frac{1}{(M - 1)} \left[ \int_0^{X_A} \frac{dX_A}{(1 - X_A)} - \int_0^{X_A} \frac{dX_A}{(M - X_A)} \right] = kC_{A0}t$$

$$\frac{1}{(M - 1)} \left[ -\ln(1 - X_A) + \ln \frac{(M - X_A)}{M} \right] = kC_{A0}t$$

$$\ln \left[ \frac{(M - X_A)}{M(1 - X_A)} \right] = C_{A0}(M - 1)kt \quad \text{Eq. VI}$$

Eq VI is the desired integrated rate equation of irreversible Second order reaction with  $C_{A0} \neq C_{B0}$  in terms of conversion.

Subject code

17562

page 23 of 28

	$\frac{V}{F_{A0}} = 36 \text{ cm}^2 \times \frac{5(l.\text{sec}/\text{mol})}{2 \text{ cm}} \times \frac{0.1}{1 \text{ cm}}$ $\frac{V}{F_{A0}} = 9 (l.\text{sec}/\text{mol})$ $V = 9 \times F_{A0} = 9 \times 10 = 90 \text{ lit.}$ <p>Volume of CSTR = <b>90 lit.</b></p> <p>For a plug flow reactor <math>\frac{V}{F_{A0}}</math> is the area under the curve from <math>X_A = 0</math> to <math>X_A = 0.6</math></p> <p>Area under the curve(I) = <math>21.5 \text{ cm}^2</math></p> $\frac{V}{F_{A0}} = \text{Area} \times (\text{Scale on } X - \text{axis}) \times (\text{Scale on } Y - \text{axis})$ $\frac{V}{F_{A0}} = 21 \text{ cm}^2 \times \frac{5(l.\text{sec}/\text{mol})}{2 \text{ cm}} \times \frac{0.1}{1 \text{ cm}}$ $\frac{V}{F_{A0}} = 5.25$ $V = 5.25 \times F_{A0} = 5.25 \times 10 = 52.5 \text{ lit}$ <p>Volume of PFR = 52.5 lit.</p> <p>Volume of PFR is less than the volume of CSTR for the same onversion. (<math>X_A = 0.6</math>)</p>	2
5-c	<p><b>Performance equation of PFR in terms of concentration and conversion:</b></p> <p>In Plug flow reactor, the composition of fluid varies continuously along a flow path, so rate of reaction also varies. therefore Material balance for any reactant A must be done over a differential element of volume dV of the reactor</p> <p>Taking material balance of a limiting reactant A, over a differential element of volume dV. Material balance equation is</p> <p>(Rate of flow of A to dV) = (Rate of flow of A out from dV) + (Rate of disappearance of A by chemical reaction within dV) + (Rate of accumulation of A within dV).....eq 1</p>	

**WINTER-16 EXAMINATION**  
**Model Answer**

For PFR ,the fourth term is zero. Therefore eq.I becomes

$$\begin{array}{lcl} \text{Rate of} & \text{Rate of flow} & \text{Rate of} \\ \text{Flow of A} & = & \text{of A} + \text{disappearance of A} \\ \text{To dV} & & \text{out from dV} \quad \text{by chemical reaction} \end{array} \quad \text{eq.II}$$

For the differential element of volume dV

Input of A, (moles/time) =  $F_A$

Output of A, (moles/time) =  $F_A + d F_A$

Rate of disappearance of A in moles/time

$$(-r_A)dV = \frac{\text{moles of A reacting}}{(\text{time})(\text{volume of fluid})} (\text{volume of element})$$

Substituting all these values in eq.II

$$F_A = (F_A + d F_A) + (-r_A)dV$$

$$\text{As } F_A = F_{A0}(1 - X_A) \text{ and } dF_A = d[F_{A0}(1 - X_A)] = -F_{A0} \cdot dX_A$$

$$F_A = F_A - F_{A0} \cdot dX_A + (-r_A)dV$$

$$F_{A0} \cdot dX_A = (-r_A)dV \quad \text{eq.III}$$

Eq.III is the differential form of design equation for a plug flow reactor. For the reactor as a whole, the equation must be integrated.  $F_{A0}$  is constant, but  $(-r_A)$  depends upon the concentration.

Rearranging the terms & integrating within limits

$$\int_0^V \frac{dV}{F_{A0}} = \int_0^{X_{Af}} \frac{dX_A}{(-r_A)}$$

$$\frac{V}{F_{A0}} = \int_0^{X_{Af}} \frac{dX_A}{(-r_A)}$$

$$V = F_{A0} \int_0^{X_{Af}} \frac{dX_A}{(-r_A)}$$

As

$$\tau = \frac{V}{v_0} = \frac{V \cdot C_{A0}}{F_{A0}} = C_{A0} \int_0^{X_{Af}} \frac{dX_A}{(-r_A)} \text{ for any } \epsilon_A \quad \text{eq.IV}$$

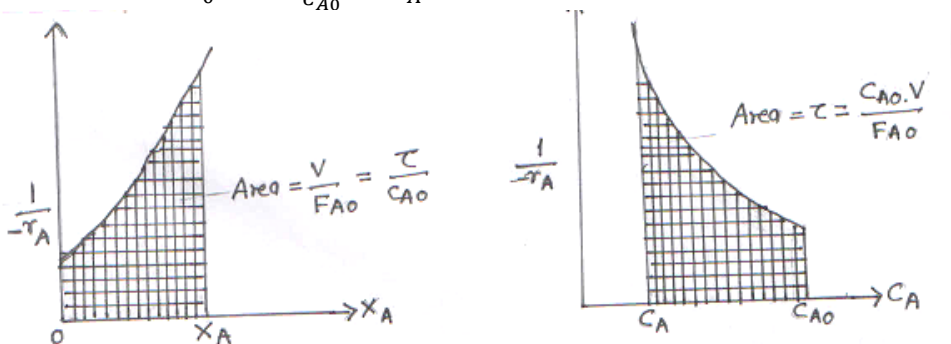

When  $X_{Af} = X_A$
